The ecologically livable city is a word that has often been seen in big media in recent years. We have two aims to build an eco-city: One is to maximize environmental protection and the other is to maximize the comfortability of the human living environment.

In this issue, we collect three articles focusing on the topic of the ecologically livable city. Cairong Wu and her colleagues discussed the path of building an ecologically livable city in Foshan from the angle of the satisfaction of the inhabitants by using the questionnaire survey method. Another case of Zhuzhou also concentrated on the satisfaction of the inhabitants. What is more, Chaoqiong Zhang lab researched the evaluation and construction of the ecologically livable city Guiyang in western underdeveloped areas.
